Modulation : varying carrier signal in accordance with message signal.

- Delta modulation
- Modulator
- Demodulator

frequency - Division
Multiplexing

wavelength - Division
Multiplexing

Digital to Analog Conversion

↓
discrete ↓
continuous

Amplitude Shift keying

→ frequency { constant
→ phase

Binary ASK

→ OOK

$$B = (1+d) * S$$

↓ ↗
Band width ranges [0, 1]

- * transmit digital data over optical fibre
- * inexpensive
- * less bandwidth

- * low power efficiency
- + noise interference causes damage

FSK

$$B = (1+d) * S + (L-1) * 2\Delta f \Rightarrow L \times S$$

2^n → frequencies } \Rightarrow 3 bit transfer needs 8 frequencies
 n → bit (number)

- * avoid noise
- * low error
- * high signal to noise ration

- * large bandwidth
- * less bandwidth efficiency
- * low power efficiency

PSK

→ susceptible to noise

- * power efficient
- * less error

- * low bandwidth efficiency
- * detection & recovery is complex

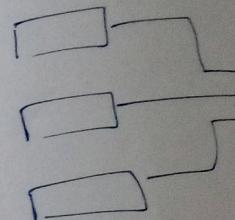

QPSK

→ Quadrature

Modulation : varying with message

→ Delta modulation
→ Modulator
→ Demodulator

frequency - Di
multiplexing

Modulators

Wavelength - M
ultiplexing

Unit 3

wire coding → code used for data transmission.

↳ (1) Unipolar

- On-Off Keying (OOK)
- Two variations
 - * Non return to zero
 - * Return to zero

Non-return
to zero

* simple

* less bandwidth

* NO error correction

* NO clock

Return to zero

* simple
* clock exist

* No error correction

* Increased bandwidth

↳ (2) Polar

NRZ

* simple

* low frequency component

* No error correction

* No clock

RZ

* simple

* low frequency component

* No error correction

* Increased bandwidth

↳ (3) Bipolar

+ - 0.

↳ duo-binary signal.

+ to - ↗
- to + ↘

Alternate
Mark
Inversion

INRZ

* simple

* low - frequency component

* No clock

* Loss of synchronization

Connecting Devices

Hubs

- outdated
- work on first layer

Routers

- works on first 3 layers

Repeater

- repeats by enhancing signal.

Switch

- regenerates signal.

Bridges

- divides big n/w to small sections.

Transparent

- unaware existence

Source route

- Token ring n/w

Unit 3

line coding →

↳ (1) Unipolar

• On-Off

• Two v

Non-return
to zero

* simple

* less bandwidth

↳ (2) F

NRZ

* simple

* low freq compone

↳ (3)

+ - 0

↳ duo-signal.

+ to -
- to +

Switch Fabric

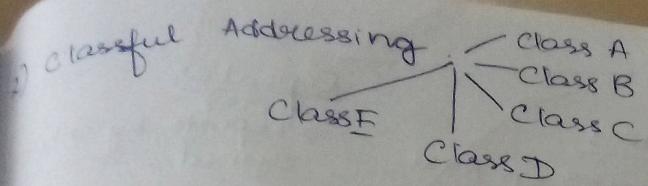

- packets routed from input ports to output ports

Switch Controller

- decision in leading the packets to the destination

OPP

- Output Post processors
- packet resequencer, error checked.

Subnetting

- allows to break a large network into smaller networks.
- reduces traffic / increases performance.
- Needs Router
- Wastage of IP.
- Needs a middle man

Subnet Mask

- routers need it.

Supernetting

- summary of many subnets.
- route summarization
- route aggregation.

①
reduces size
better overview n/w

NAT

- multiple devices access the ~~net~~ internet through one public network.

→ Static NAT: 1 Private IP mapped to 1 Public IP.

Eg: web hosting

→ Dynamic NAT: 1 Private IP mapped to 1 Public IP through a pool of Public IP.

→ PAT: Port Address Translation.

→ distinguish traffic.

✓

- Privacy
- legal registered IP.
- No renumbering

✗

- NAT always doesn't work
- complicates protocols.

UNIT - 2

IPV4 → assigning logical address to host

Binary form → 11000000.00000011.01010011.10000001
Decimal form → 117.123.10.11

Address space: range of logical space where data can be stored.

Eg: RAM.

Subnet mask: Used to designate subnets/Local LANS

Addressing Modes

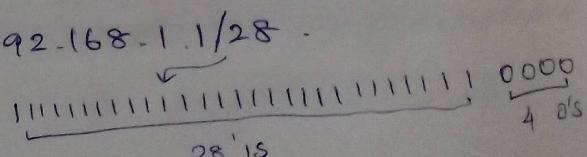

- 1) Unicast : Sent to one destination host
- 2) Broadcast : Sent to all connected devices
- 3) Multicast : Combines both

Special IP address

- 1) IP: 0.0.0.0 - disengaged from network
- 2) IP: 240.0.0.0 - experimental use
- 3) IP: 127.0.0.1 - loopback address
- 4) IP: 10.0.0.1 - default gateway address
- 5) IP: 224.0.0.0 - multicast address
- 244.0.0.255

Addressing Types

1) Classless Addressing . 192.168.1.1/28 .

CIDR :- 2 groups
network/subnet address
host address .

2) Classful Addressing
Class

Subnetting

- ✓ → allows to break networks
- ✓ → reduces traffic
- ✗ → Needs Router
- ✗ → wastage of IP
- ✗ → needs a router

Subnet Mask

- routers need

Supernetting

- summary
- route summarization
- route aggregation

NAT

- multiple devices share one public IP

Static NAT

Eg: Web browser

Dynamic NAT

through port forwarding

PAT

⇒ di

- Private IP
- legal
- No port forwarding

Forward Error Correction (FEC)

Error Correction Codes (FEC)

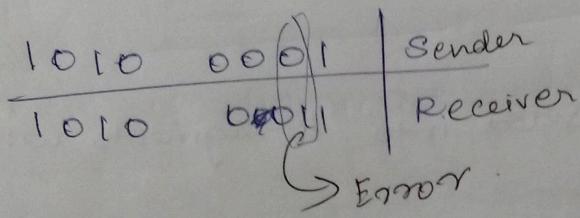

1. Hamming codes \longrightarrow block
2. Binary convolution code \rightarrow convolution
3. Reed-Solomon code. $\left\{ \begin{array}{l} \text{block} \\ \text{code} \end{array} \right.$
4. Low-Density Parity Check
5. detecting upto 2 simultaneous bit errors
and correcting single bit errors.
6. an encoder process an input sequence of
bit of arbitrary length and generates
a sequence of output bits.
7. correcting burst errors
8. parity check

Types of error

1. Single Bit error

Only 1 bit of given data unit is changed from 1 to 0 (or) 0 to 1

↳ Parallel data transmission.

2. Burst error

Two or more bits are changed from 0 to 1 & 1 to 0.

↳ Serial data transmission.

Demerits

$$1.) \text{Time to Live (TTL)} = 2 * \text{Time Out}$$

↳ Data Lives for how long.

(Max : 180 seconds)

Error Control

3 Techniques

~~Flow~~ ARQ

Automatic Repeat Request } (concept)
Repeat Request } (all 3 same).

① Simple stop and wait

Sender:

Rule 1 : Send 1 data packet at a time

Rule 2 : Send next pkt after receiving
ack for previous

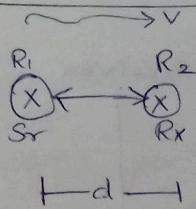

Receiver:

Rule 1 : Send ack after receiving &
consuming data packet

Rule 2 : After Consuming the packet ack
needs to be sent.

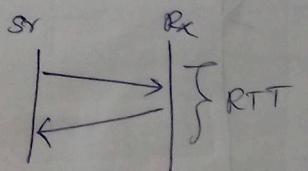

Terms

$$1) \text{Propagation Delay} = \frac{\text{Distance between Routers}}{\text{Velocity of propagation}}$$

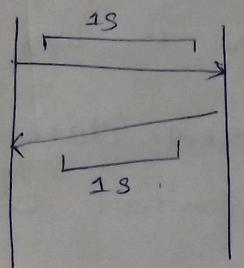

$$\begin{aligned} & \text{m} \\ & \text{ms}^{-1} \\ & =(s) \\ & \downarrow \text{time} \end{aligned}$$

$$2) \text{Round Trip Time (RTT)} = 2 * \text{Propagation Delay}$$

$$3) \text{Time Out} = 2 * \text{RTT}$$

Takes $2s$ to get acknowledgement.

Time Out

So there is an error

Data

Ack -

(Max: 17)

Error Control3 Techniques

~~Seq~~ ARQ
Auto

① Simple stop

Sender:

Rule 1 :

Rule 2 :

Receiver:

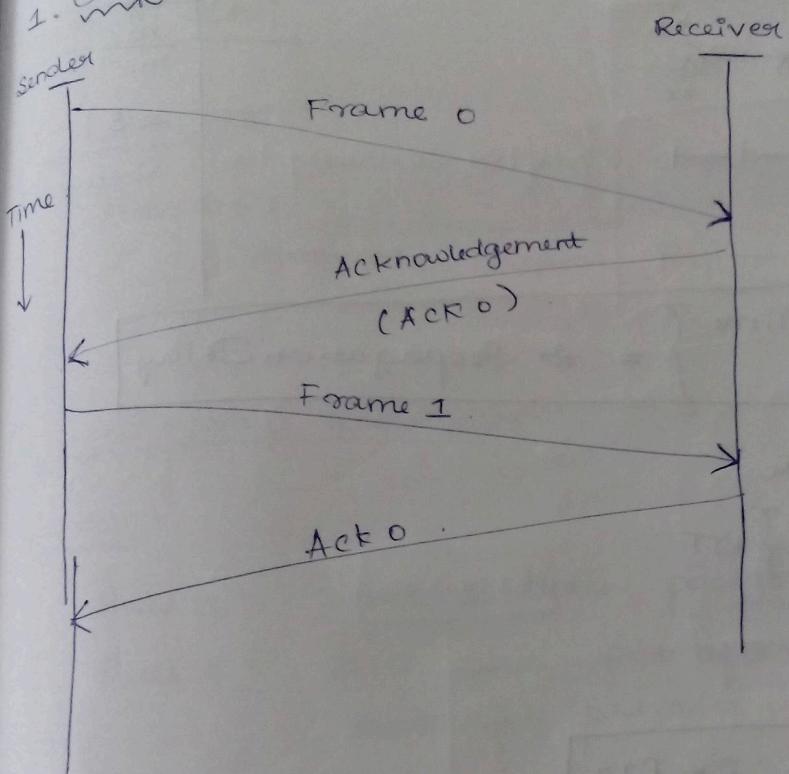

Rule

Rule

2 mechanism

1. Stop & wait
2. Error control

EFD
= 0 (111)
containing
1's
so bit
Stuff
0

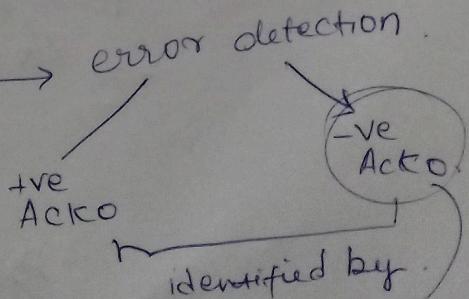

2. Error control

Error occurs when there is loss of data.

Sender : Did I send correct data?

Receiver : Did I receive correct data?

To find error → error detection.

Rectification

↳ Retransmission.

Error Data
Transmission

Bit stuffing

Data : $\begin{array}{ccccccc} 0 & 1 & 1 & 1 & 0 & 0 & 0 \end{array}$

$\approx \text{EFD in Data}$

Stuff 0 after 3 1's.

0 1 1 1 0 0 0 1 1 1 0
 \downarrow
 Bit stuffing

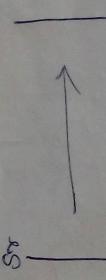

Eg Data 110001001

EFD $\begin{array}{c} 100 \\ \diagup \quad \diagdown \end{array}$

continuous 0's so bit stuff 1

1100101001
 \downarrow
 Bit stuff

Flow Control

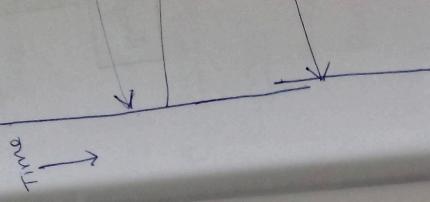

50 bps \rightarrow Traffic & loss of data

100 bps \rightarrow mismatched idle reservation
 50 bps

mechanism

- 1. Stop &
- 2. Error

1. Stop and
send a
frame

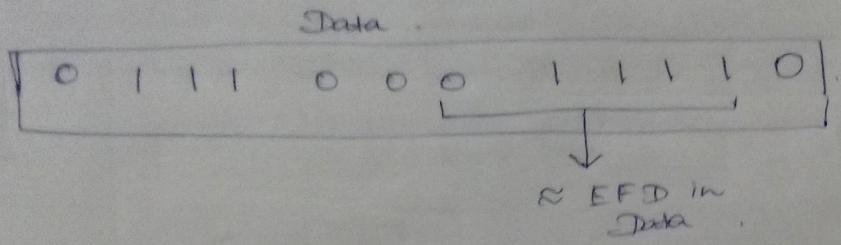

2. Error
 $\approx \text{SNR}$
 $\approx \text{To}$

Rx

idle reservation

Bit Stuffing

EFD
= 0(111)
continuous 1's
so bit stuff 0

Stuff 0 after 3 1's.

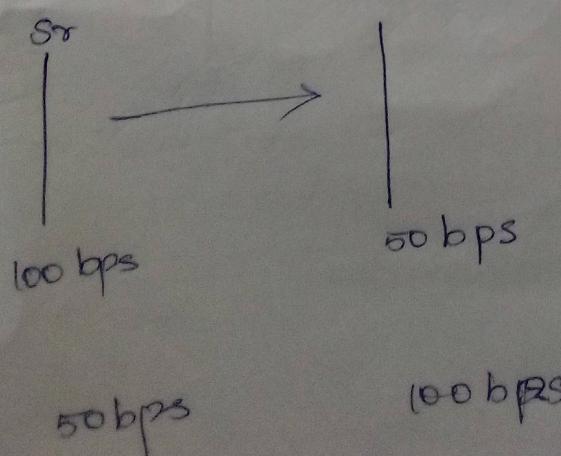

0 1 1 1 0 0 0 0 1 1 1 0 1 0.

Analog signal

Delta D

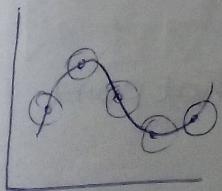

1010
dig
do

6 samples
 random interval regular interval
 Eg: every 1s

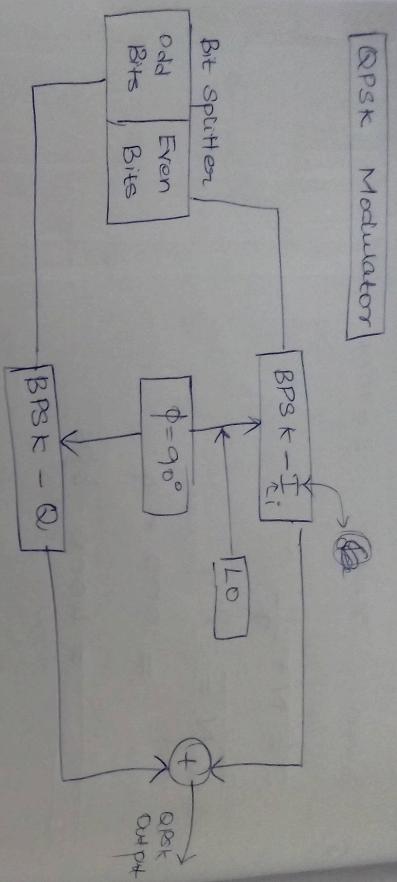

① Analog signal

Quadrature PSK

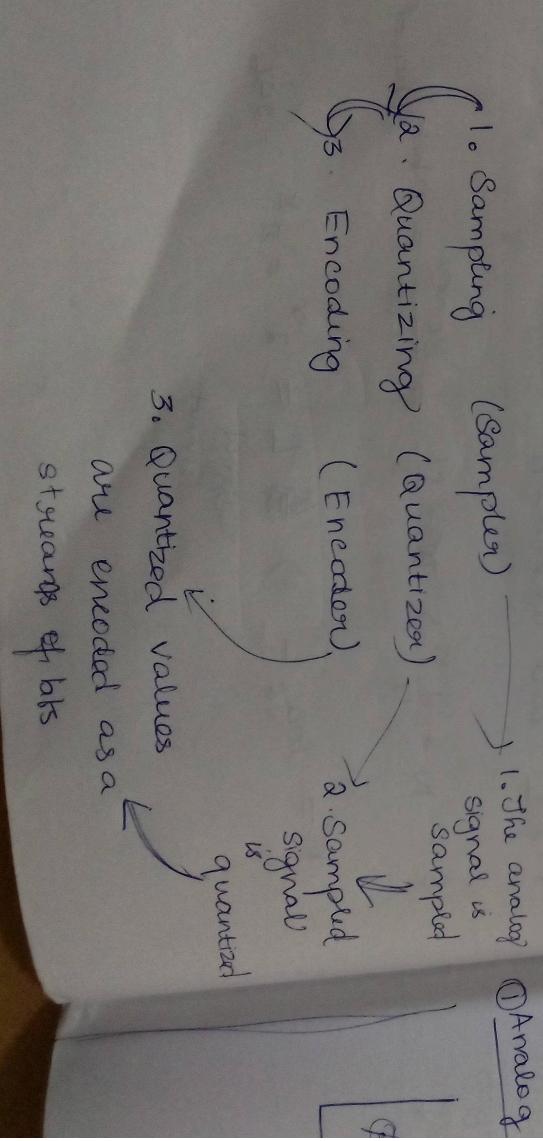

2 bits can be transmitted at a time.

Phase shift can be done for $\phi = 90^\circ$ (or)
 $\phi = 180^\circ$, $\phi = 270^\circ$, $\phi = 0^\circ$.

Analog to Digital conversion

Pulse Code Modulation (PCM)

1000 elements
per second

In analog signal carries
signal element. If 1000 signal elements pass
sent per second find the bit rate.

1 element.

$$\text{Given: } r = 4 \quad S = 1000 \quad N = ?$$

$$S = N * \frac{1}{r}$$
$$N = S * r$$
$$= 1000 * 4$$
$$= 4000 \text{ bps}$$

Q) An analog signal has a bit rate of 8000 bps
with a baud rate of 1000 baud. How many bits
elements are carried by each signal
element? How many signal elements do we
need?

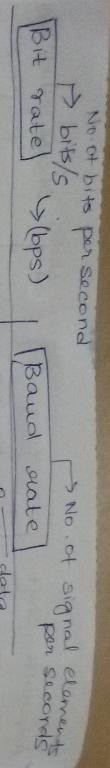

$$S = 1000 \quad N = 8000$$

r & L are unknown.

$$\frac{4}{3}$$

$$S = N * \frac{1}{r} \Rightarrow r = \frac{N}{S} = \frac{8000}{1000} = 8 \text{ bits/baud}$$

$r = \log_2 L \Rightarrow L = 2^r = 2^8 = 256$
Signal current

for analog signal

transmit receiver
medium
→ copper cable.
→ optic fibre.

③ \Rightarrow Used to convert networking data
format to another

transfer
also block

to 2

2

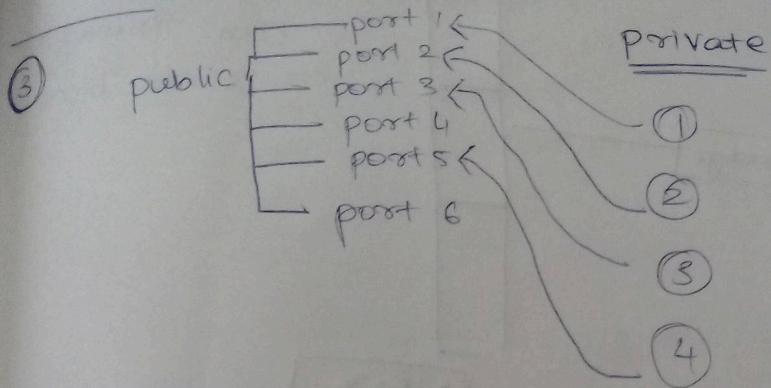

- 1. Larger n/w into smaller sections.
- 2. Sifting b/w 2 physical n/w segments 2 manage the flow of data b/w the 2
- 3. By using MAC Address.

Types of Bridges

1. Transparent Bridge.
 2. Source route Bridge.
 3. Translational Bridge
- ① ⇒ (i) unaware of its existence
(ii) forward the data based on MAC address.

② ⇒ The entire path the packet is to take through the network is embedded within the packet.

Demerit: Loss of data due to excess waiting time

Next Class: Interconnections

Hubs

→ no knowledge on destination

① Physical layer (OSI)

→ Data repeater

→ gathers as frames and delivers

Switches

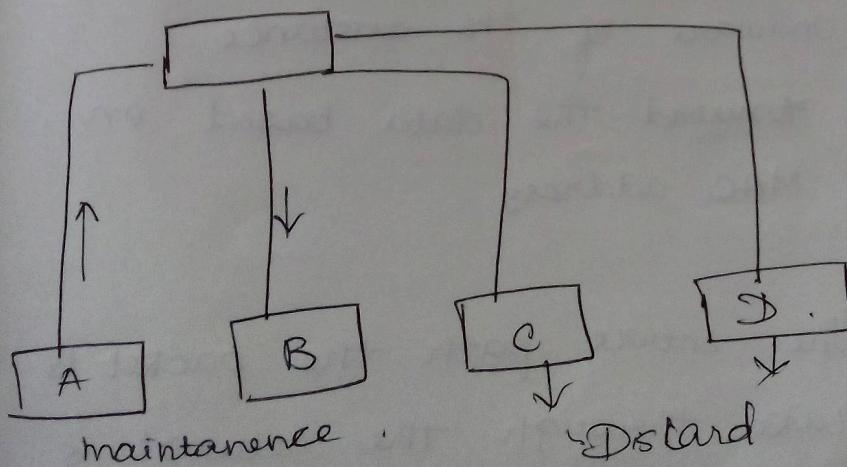

- 1 - Physical Layer
- 2 - Data Link Layer

Bridges

- 1 - Physical
- 2 - Data Link

Routers

- 1 - Physical
- 2 - Data Link
- 3 - N/W

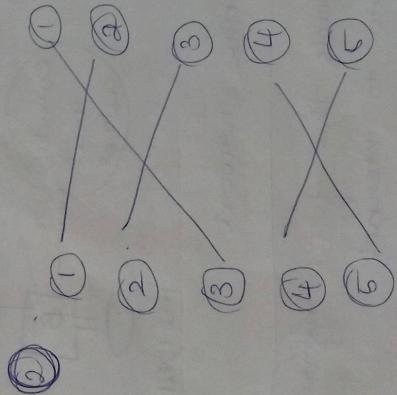

1. Static NAT (Private to Public)
2. Dynamic NAT Translation (PAT)
3. Port Address Translation

① Mapped 1 Private

1 Private

Demand: Large amount ~~per of~~
public addresses

Allocated
dynamically.

Routing table
does that.

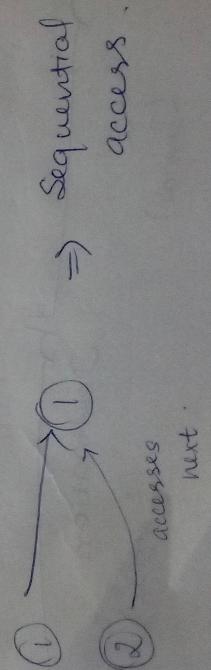

Routing table is
also updated
regularly.

Private
7
Public

① Physical
layer (OSI)
→ no revolution
in distribution
Hubs

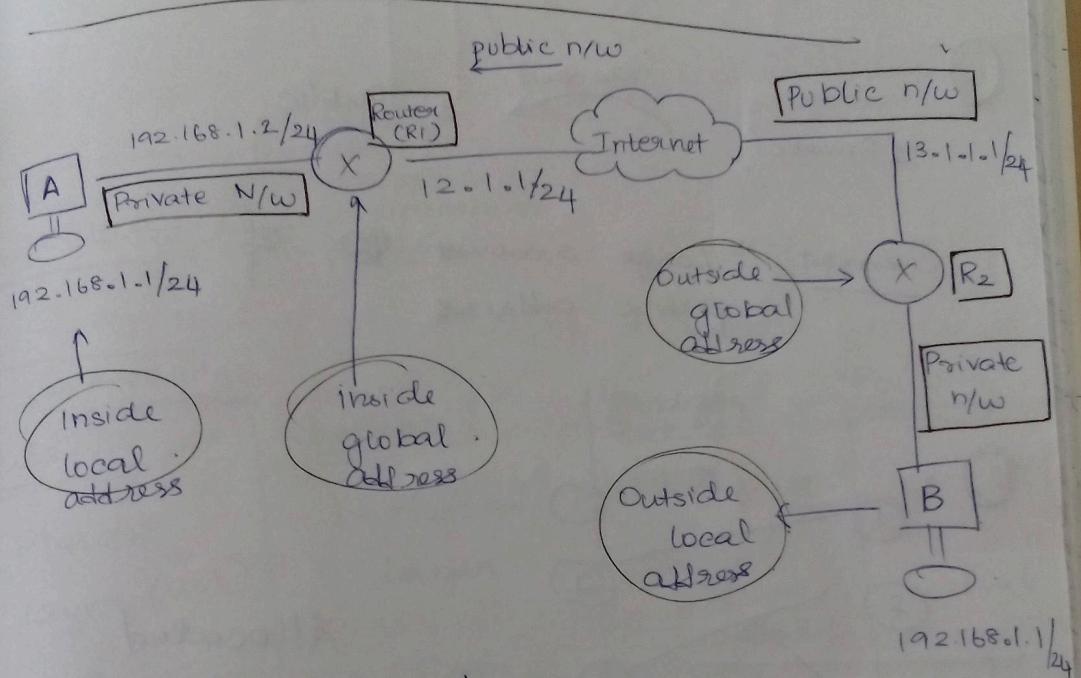

② Data separate
→

→ gathers
and

 east
 early
 registration is
 must

Private network:

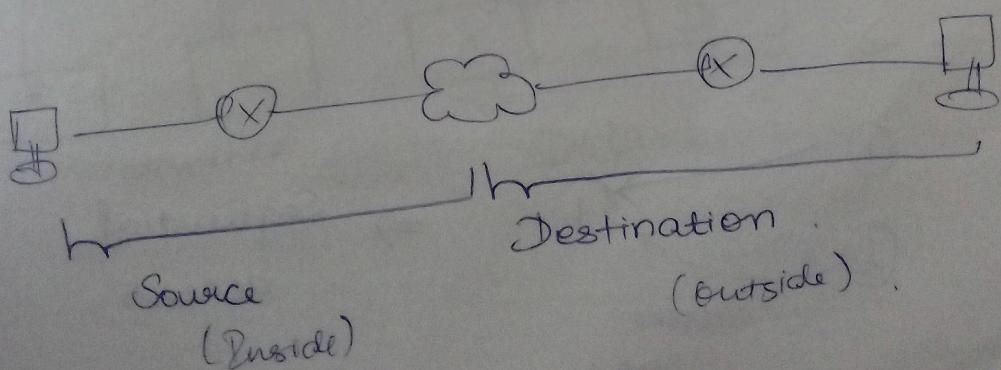

Cannot be transferred
to net

Local to system

Public network.

Needs this for transferring
data to internet

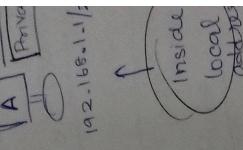

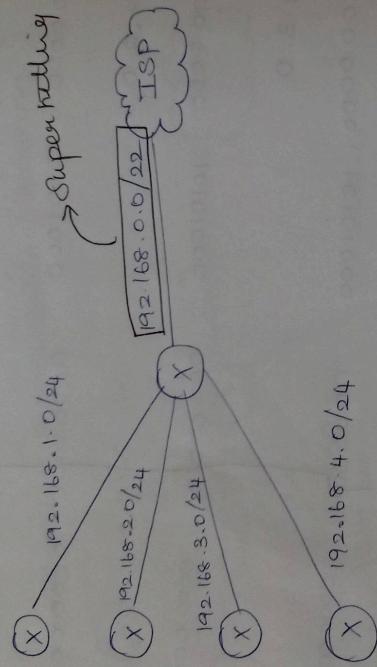

Early registration

Step 4 New Subnet Mask

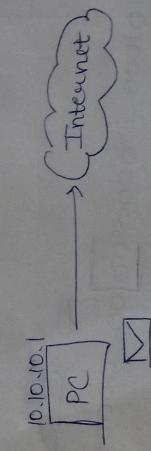

$$\begin{array}{r} \text{Local IP Address} \\ \text{Private} \\ \hline 1111 1111 & 1111 1110 & 0000 0000 \\ \hline & 255 & 0 \end{array}$$

$\Rightarrow 255.255.252.0 /22$

Private IP

Address Translation (NAT)

Cannot go to net

Local to

While transferring data from PC to internet,
the same address is not used. Because it is
(10.10.10.1) private.

256 64 32 16 8 4 2 1

$$\begin{array}{r} 192 \\ 128 \\ \hline 64 \end{array}$$

192.168.0.0

↳ 1100 0000

1010 1000 0 0 .

$$\begin{array}{r} 168 \\ 128 \\ \hline 40 \end{array}$$

Step 1.

$$192.168.0.0 \Rightarrow 11000000 \times 10101000 \quad 00000000 \quad 00000000$$

192.168.0.0

↳ 1100 0000 10101000

0000 0001 0000 0000

192.168.2.0

↳ 1100 0000 10101000

0000 0010 0000 0000

192.168.3.0

↳ 1100 0000 10101000

0000 0011 0000 0000

all equal
22 bits

→ changes.

Step ③ \Rightarrow

1100 0000 10101000 0000 00 00 00000000

Step 4

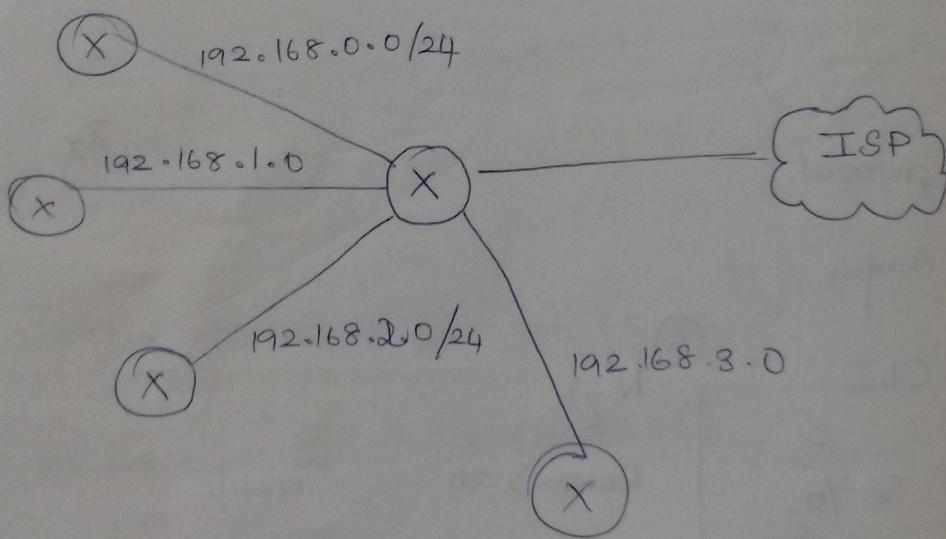

~~Next~~
N/w ID:

1100 0000 10101000 0000 0000 0000 0000

↳ 192.168.0.0

Supernetting

1. It is reverse of subnetting
2. Combining multiple networks to single network.
3. Converting from network bits into bit
4. Also known as CIDR
(classless interdomain routing)

Step 1: Write all numbers into binary

Step 2: Find matching bits left to right upto match.

Step 3: Write upto match and '0' upto end (net ID)

Step 4: upto match put all '1's (subnet mask)

128 64 32 16

192.168.0.0

↳ 1100 00

1010

Step 1.

192.168.0.0

192.168.1.0

↳ 1100 0000

192.168

↳

Step 3 =>

1100 000

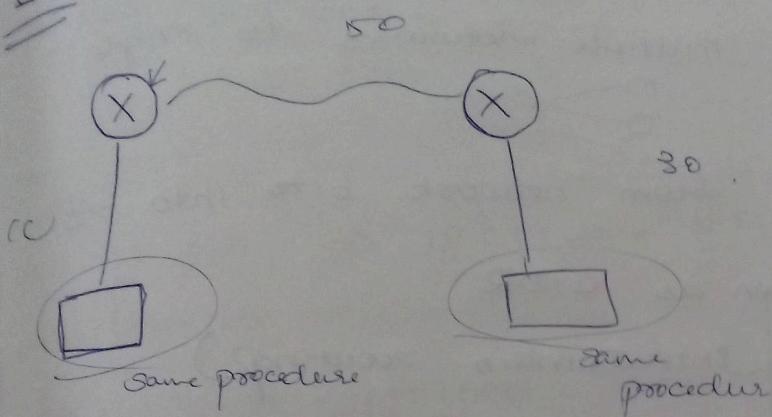

~~New N/w ID:~~

1100 0

↳ 192

Routing

Subnet mask:

- ↳ Sub part of
- ↳ Network

→ reducing addressing phase

255.255
fixed

host part alone
is assigned.

Subnet mask hides/masks the network part of a system's IP address and leaves only the host part as the machine identifier.

Classful IP Addressing

10.10.10.1
N/W Host

(OR)

10.10.10.1
N/W Host

How to know? ⚡ by subnet mask.

→ subnet mask:

255.255.255.0
fixed Variable

Subnet mask:

(255.255.0.0)
fixed Variable

192.168.1.1 / 28
IP Address Subnet mask

→ 28 1's are written

255.255.255.240
1111 1111 1111 1111 . 1111 1111 . 1111 0000
only this is variable

 r

255

(a) $111 \cdot 56 \cdot 45 \cdot 78$ $\begin{array}{r} 64 \\ 32 \\ \hline 128 \end{array}$ $\begin{array}{r} 64 \\ 32 \\ 16 \\ \hline 32 \end{array}$ $\begin{array}{r} 8 \\ 4 \\ 2 \\ 1 \\ \hline \end{array}$

$0110\ 1111 / 0011\ 1000 / 0010\ 1101$

(b) $221 \cdot 34 \cdot 7 \cdot 82$

$1101\ 1101 / 0010\ 0010$

$0000\ 0111 / 0101\ 0010$

RW

$$\begin{array}{r} 111 \\ - 64 \\ \hline 47 \\ - 32 \\ \hline 15 \end{array}$$

$$\begin{array}{r} 64 \\ 78 \\ \hline 14 \\ - 64 \\ \hline 24 \\ - 16 \\ \hline 8 \end{array}$$

$$\begin{array}{r} 11 \\ 221 \\ 128 \\ \hline 89 \\ - 89 \\ \hline 0 \\ 64 \\ \hline 29 \\ - 29 \\ \hline 0 \\ 16 \\ \hline 13 \end{array}$$

Ans:

$111 \cdot 56 \cdot 45 \cdot 78$

$\Rightarrow 0110\ 1111\ 0011\ 1000\ 0010\ 1101\ 0100\ 1110$

$221 \cdot 34 \cdot 7 \cdot 82$

$\Rightarrow 1101\ 1101\ 0010\ 0010\ 0000\ 0111\ 0101\ 0010$

Find errors

a) $111 \cdot 56 \cdot 045 \cdot 78$

→ zero should not be used before decimal number.

b) $221 \cdot 34 \cdot 7 \cdot 8 \cdot 20$

→ No 5th blocks

c) $75 \cdot 45 \cdot 301 \cdot 14$

→ only within 0-255

d) $1110\ 0010 \cdot 23 \cdot 14 \cdot 67$

out of bounds.

→ No binary & decimal mixture.

2) $(168)_{10} \rightarrow \text{binary}$

$$\begin{array}{r} 168 \\ 2 \overline{)168} \\ 84 \\ 2 \overline{)84} \quad 0 \\ 42 \\ 2 \overline{)42} \quad 0 \\ 21 \\ 2 \overline{)21} \quad 0 \\ 10 \\ 2 \overline{)10} \quad 1 \\ 5 \\ 2 \overline{)5} \quad 0 \\ 2 \\ 2 \overline{)2} \quad 1 \\ 0 \end{array}$$

$$\Rightarrow (10101000)_2$$

Change the following IPv4 addresses from
Binary notation to dotted decimal notation

$$(a) \begin{array}{c} 10000001 \\ | \\ 00001011 \\ | \\ 00001011 \\ | \\ 1110 \end{array} \quad \begin{array}{l} 128 \\ 64 \\ 32 \\ 16 \\ 8 \\ 4 \\ 2 \end{array}$$

$$129.11.11.239$$

$$(b) \begin{array}{c} 11000001 \\ | \\ 10000011 \\ | \\ 00011011 \\ | \\ 1111 \end{array} \quad \begin{array}{l} 128 \\ 64 \\ 32 \\ 16 \\ 8 \\ 4 \\ 2 \end{array}$$

$$193.131.27.255$$

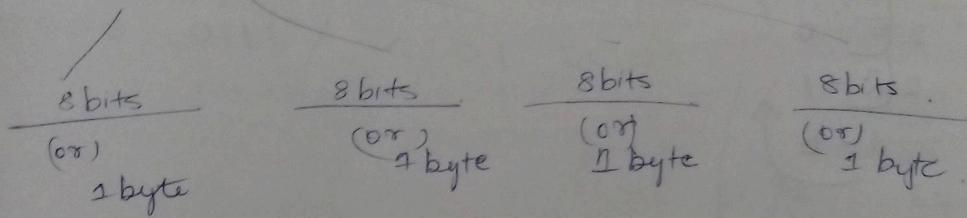

Change the following IPv4 address from
dotted decimal to binary.

UNIT - II

IPv4 Addressing:

→ cannot retain / maintain the address for a long time.

32 bits.

Binary 11000000 * 10101000 * 00001010 * 00000000
 Dotted-Decimal 192 . 168 . 10 . 1

$$\begin{array}{r}
 128 \left(\begin{array}{c} 64 \\ - \end{array} \right) 32 \left(\begin{array}{c} 16 \\ - \end{array} \right) 8 \left(\begin{array}{c} 4 \\ - \end{array} \right) 4 \left(\begin{array}{c} 2 \\ - \end{array} \right) 1 \left(\begin{array}{c} 1 \\ - \end{array} \right) \\
 \hline
 7 \left(\begin{array}{c} 6 \\ - \end{array} \right) 2 \left(\begin{array}{c} 4 \\ - \end{array} \right) 3 \left(\begin{array}{c} 2 \\ - \end{array} \right) 1 \left(\begin{array}{c} 1 \\ - \end{array} \right) 0 \left(\begin{array}{c} 0 \\ - \end{array} \right)
 \end{array}$$

$$\begin{array}{r}
 192 \\
 -128 \\
 \hline
 64
 \end{array}$$

$$\begin{array}{r}
 168 \\
 -128 \\
 \hline
 40
 \end{array}$$

0000 0000 → 0 min

1111 1111 → 255 max

¶

Convert binary to decimal.

1. $(11000000)_2$.

$$= 128 + 64 + 0$$

$$=(192)_{10}$$

Allocation of Frames

- In each process, min no 8 page

Allocation Alg

- Equal Allocation
- 93 free frames
- 5 processes
- $\frac{93}{5} = 18$ frames
- Remaining 3 frames added to pool of free frames

Page 114

Proportional Alloc

- Based on process size
- $P_1 = 10 \text{ KB}, P_2 = 27 \text{ KB}$
- Free frames = 62
- $P_1 = 31$ (not required)

$$S = \sum s_i$$

$$a_i = \frac{s_i}{S} \times m$$

$$S = 10 + 127 - 137$$

$$a_1 = \frac{10}{137} \times 62 \approx 4$$

$$a_2 = \frac{127}{137} \times 62 \approx 57$$

Global VS Local Allocation

↓

Loses frame from other processes

within a process

THRASHING (?)

- Process → paging more time (page fault) than execution
- avoided by local replacement

Working set Model

10 slots WS

$WS(L_1) = \{1, 2, 5, 6, 7\}$

$WS(L_2) = \{3, 4\}$

$$D = \sum WSS_i$$

$(D) > m$, thrashing occurs
